

FRICTIONLESS PRIVILEGED ACCESS

www.authnull.com

PROBLEM: PAM SOLUTIONS ARE HIGH FRICTION, AND DATED

Top 3 Challenges With Legacy Solutions According To Customers

High Friction & TCO

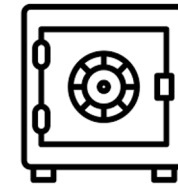

- Slow onboarding - **requires admin & user training**³
- Significant **overhead for IT** to setup and manage²

Identity is the missing link

- **Identity linked privileged access unavailable**
- **Missing M2M** auth features

Vaulted Credentials

- Pose a **significant attack vector**¹
- Remain a significant source of **credential theft**.⁶

¹ [LastPass has revealed a second attack that compromised encrypted password vaults](#) - The Hacker News

² [Why Do PAM Deployments Take \(almost\) Forever To Complete?](#) - The Hacker News

³ [Initial user onboarding process](#) - CyberArk Implementation Program Guide

⁴ [Cyberark Siphoning from OKTA after mishandled attack](#) - OKTA Attack

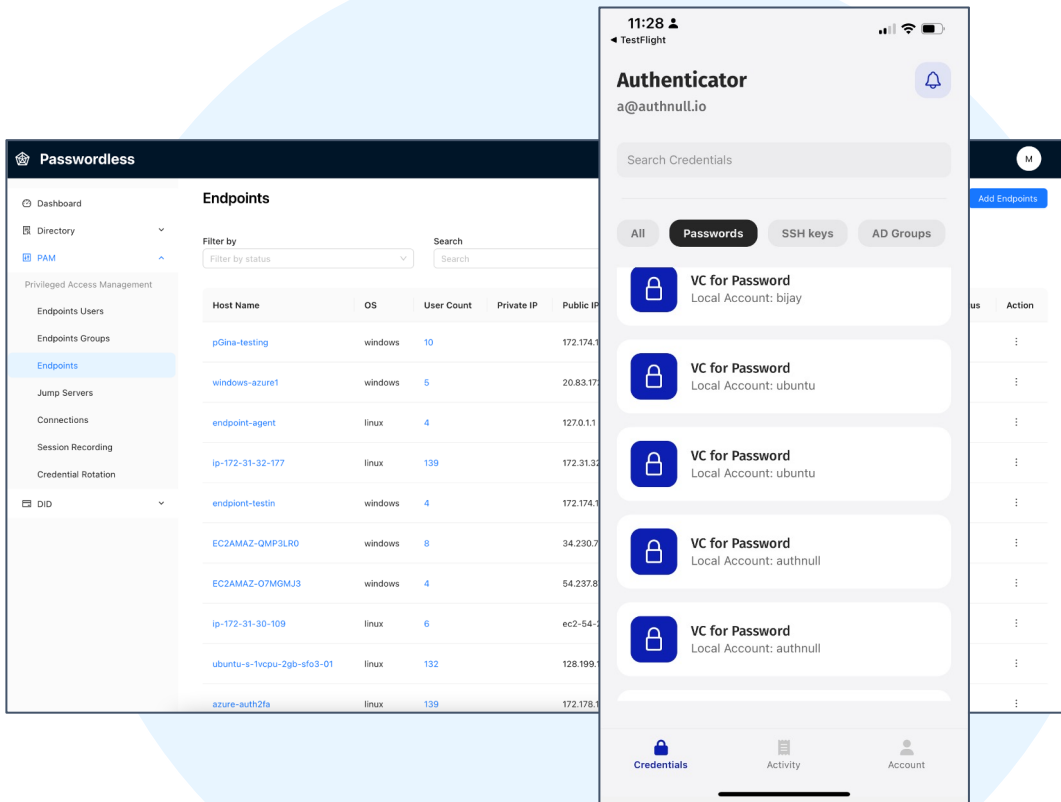

⁵ A typical customer like Broadcom has 1 full time PAM, 1-2 IAM engineers requiring training costing at least \$450k a year to just to maintain these systems.

⁶ It costs about equates about 6.5 full time resources for each co to provide support through IT help desk.

⁶ Nearly 50% of all attacks are linked with credential theft, [Verizon security investigations report](#)

MODERN, FRICTIONLESS PRIVILEGED ACCESS

Identity aware authentication with easier implementation resulting in lower total cost of ownership (TCO)

Automated policy discovery & adoption
enables accelerated rollout to zero trust

Modern Privileged Access
simplified experience minus clunky UX.

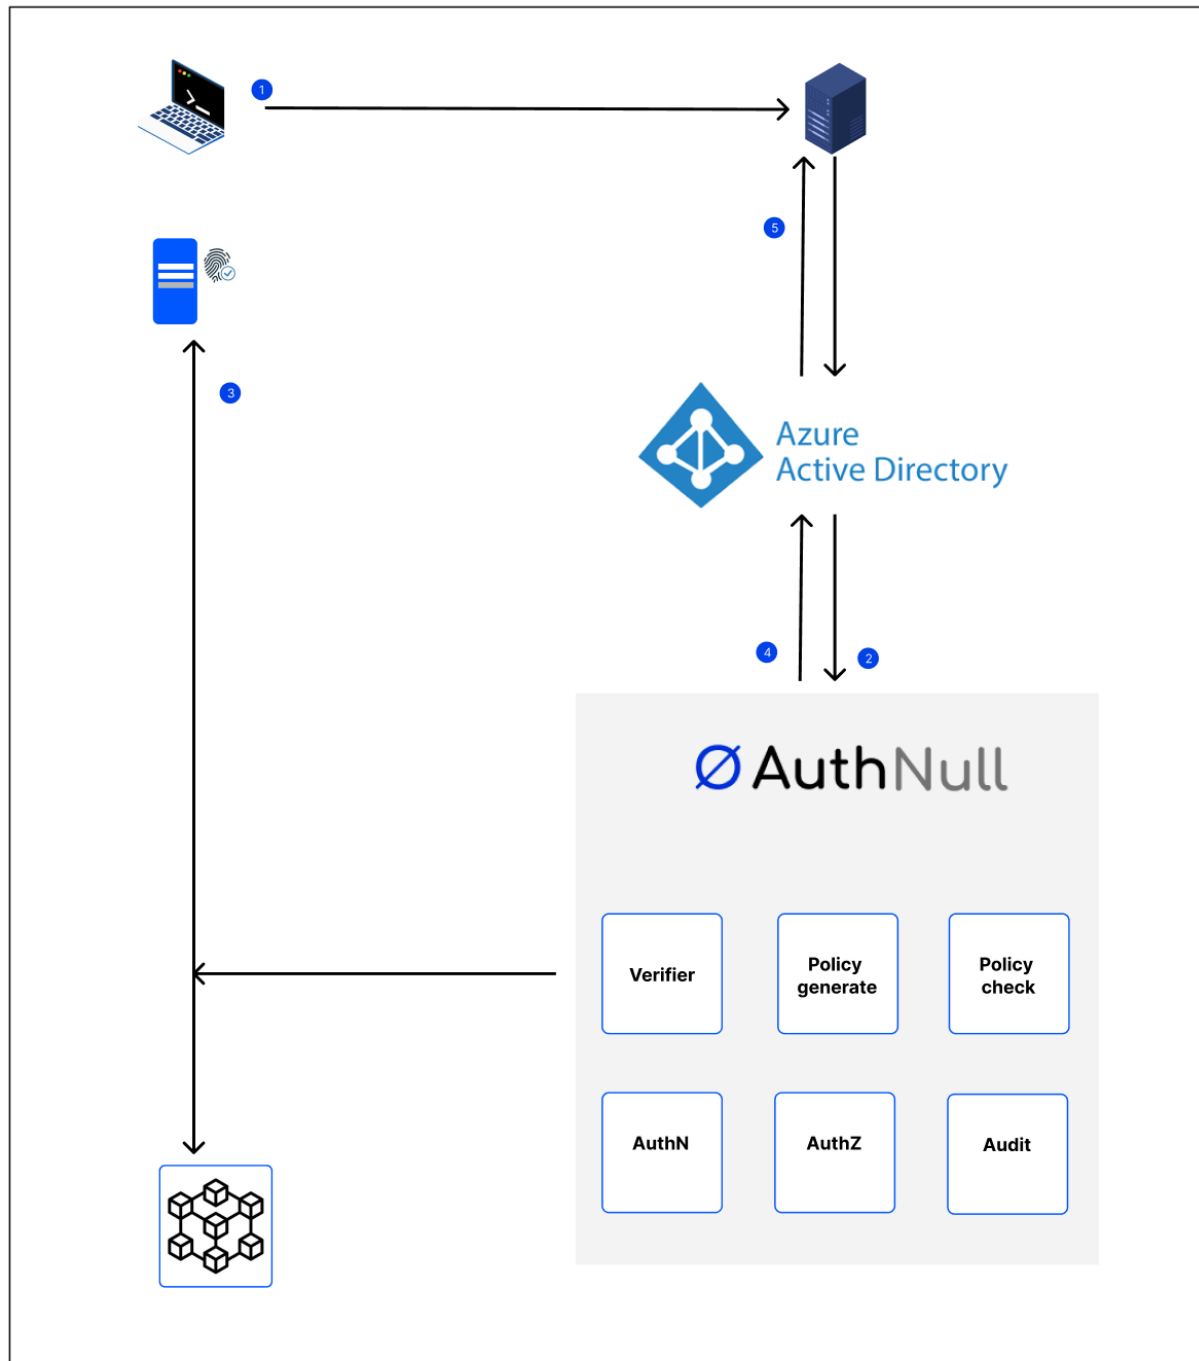

Identity aware Biometric MFA
to risk based authentication.

Vault-less
No centralized vault removes major attack vector.

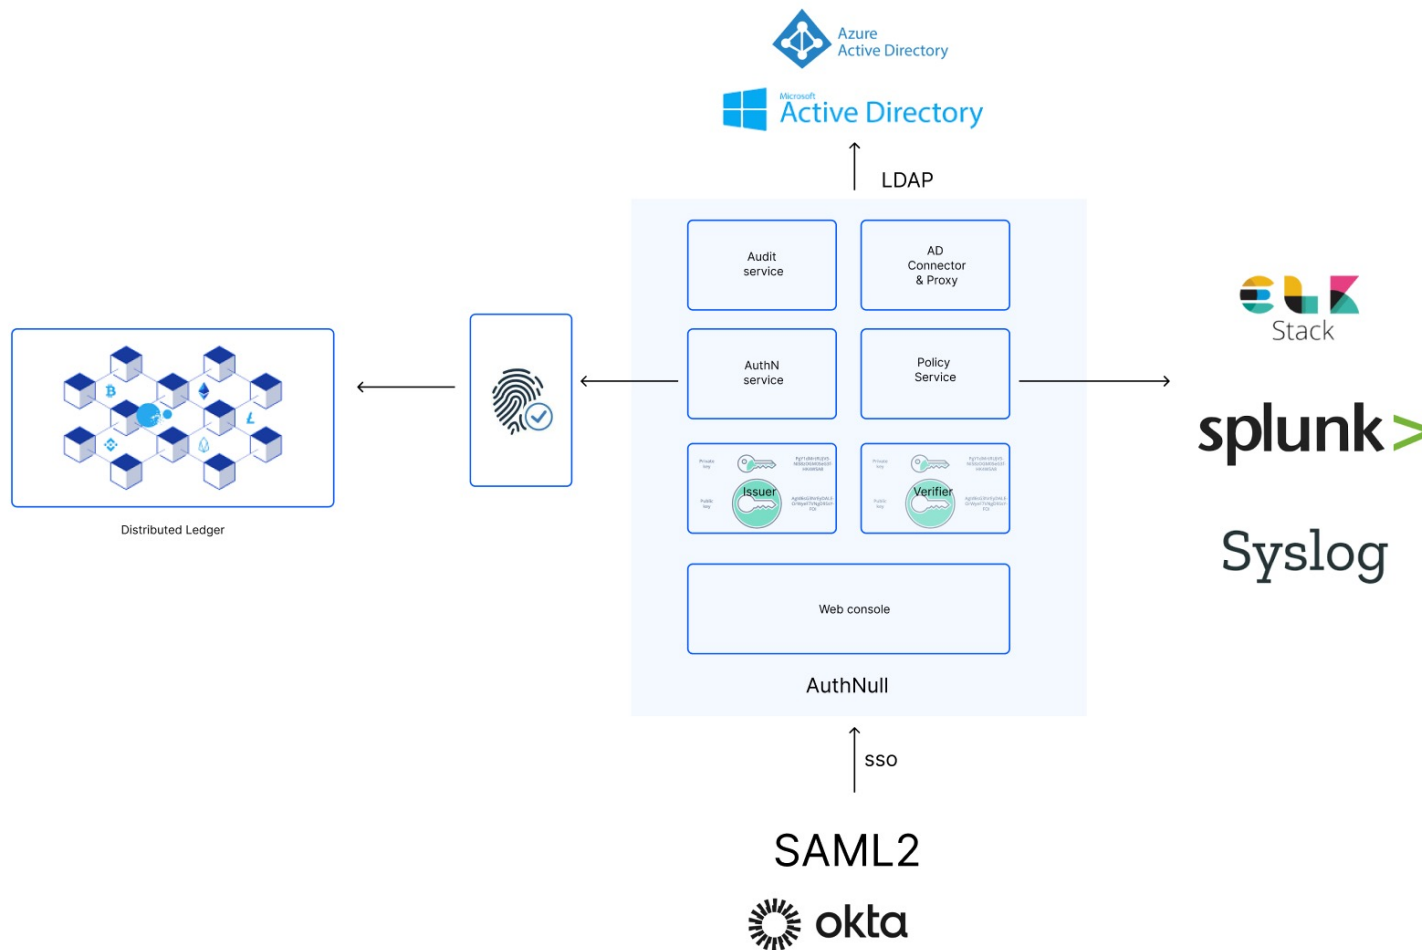

HOW IT WORKS

How it works

1. User requests access to resource
2. Active directory passes authentication to to AuthNull
3. AuthNull initiates biometric verification & validates user policies
4. Authenticate the user to the endpoint, Audit user log activity
5. User is authenticated and logs into the endpoint

FLEXIBLE YET MODERN ARCHITECTURE

- Auto discover policies with simplified design delivers significantly lower TCO
- Work with, or without existing directories; support a wide variety of use cases
- Biometric wallet provides secret store and authentication

Deliver authentication with, or
without active directory

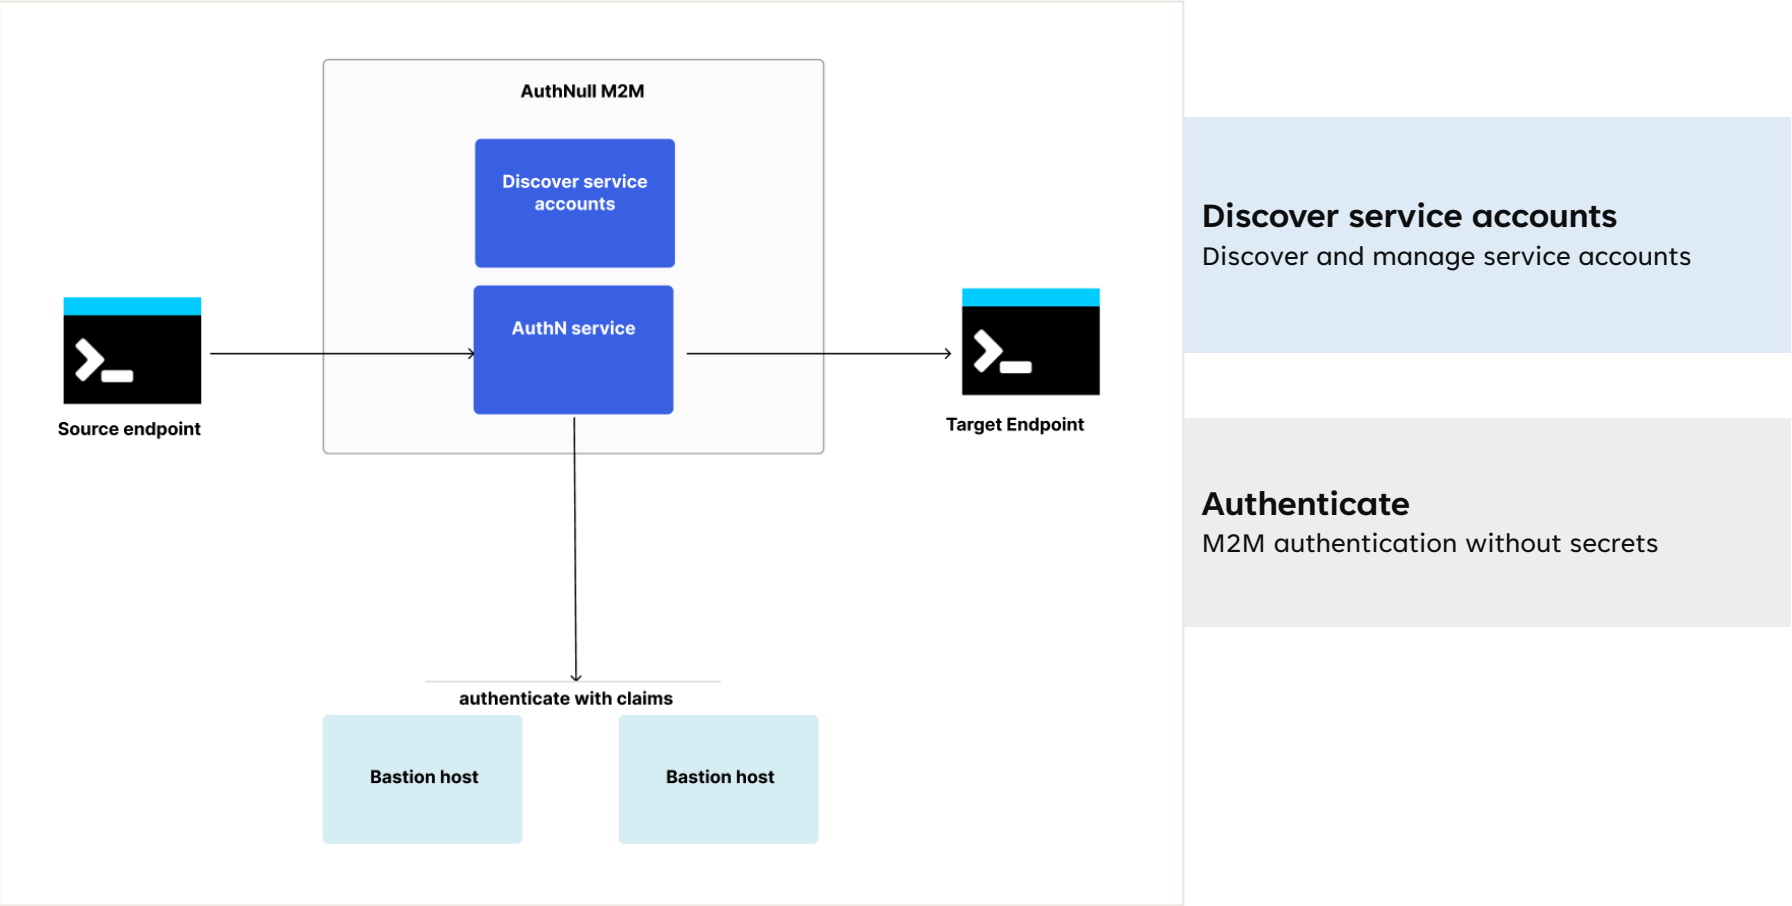

DYNAMIC PRIVILEGED ACCESS

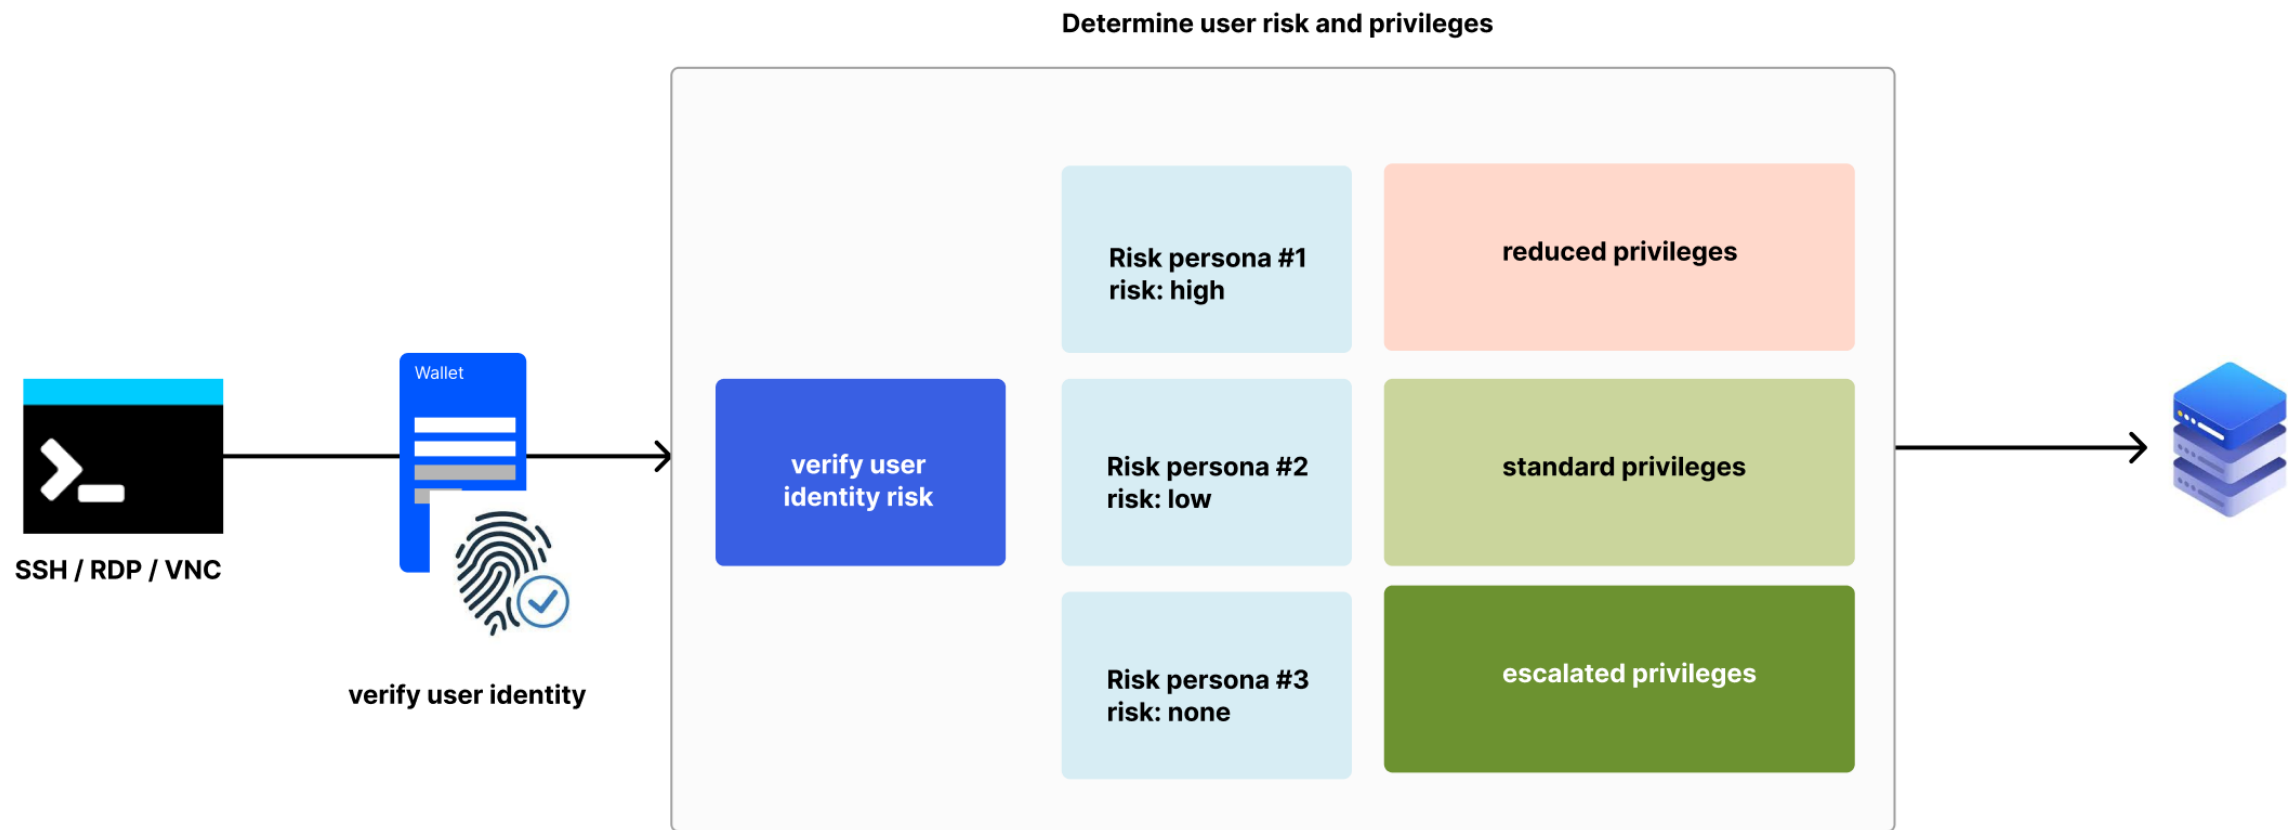

DELIVER JUST IN TIME ACCESS

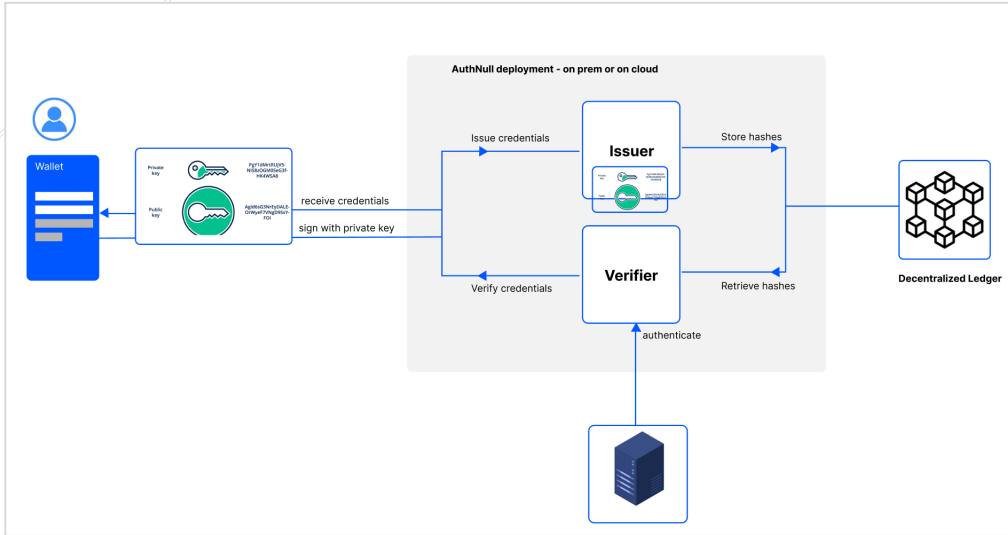

DISCOVER & MANAGE SERVICE ACCOUNTS

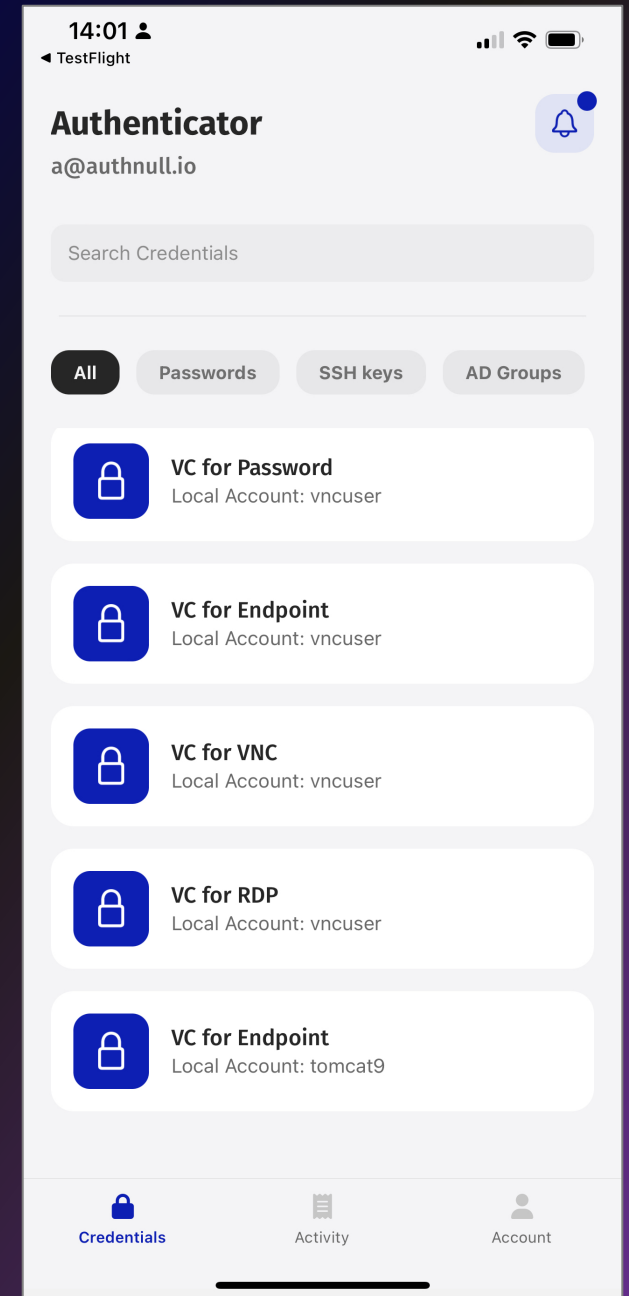

IDENTITY RISK AWARE AUTH-N AND AUTH-Z

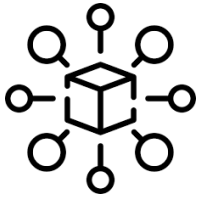

VAULTLESS SECRETS WITH BIOMETRIC WALLET

- Uses public key cryptography to manage secrets without centralized vault
- Store credentials using a decentralized wallet that provides biometric auth & MFA

WHY AUTHNULL?

Decentralized Identity

AuthNull delivers PAM as a decentralized id platform

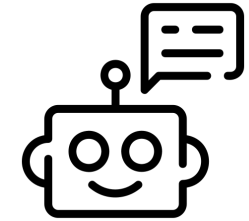

Identity aware biometric 2FA

Reduces identity risk

Dynamic AuthZ

Dynamic authZ delivers rule based conditional access with zero standing privileges.

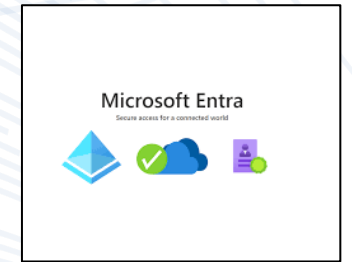

AI Sec Ops

AI assistant to make your PAM rollout significantly faster and easier.

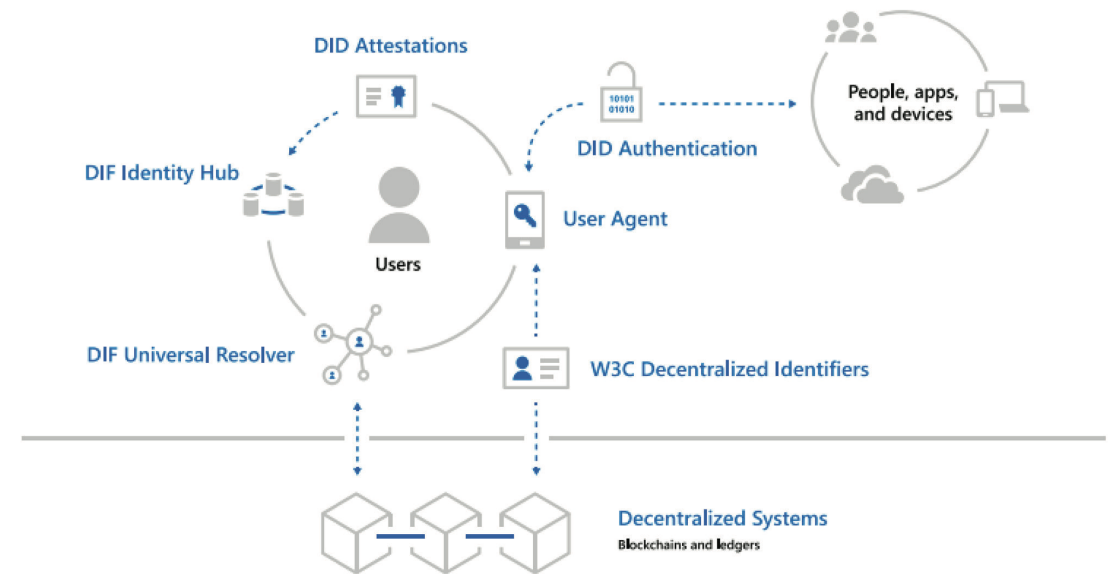

APPENDIX

BUILT ON DECENTRALIZED IDENTITY

Microsoft Entra ID uses the same stack

- AuthNull delivers all credentials as Decentralized Credentials
- Organizations verify real world identity and issue a Decentralized Identity (DID) and Verified Credentials (VC) after onboarding users through an IDP.
- AuthNull uses the W3C Decentralized Identity (W3C DID) standards and W3C Verified Credentials (W3C VC).
- Every organization / user is issued a unique DID., identifiers that are generated using [EDSA / ED25519](#) signature scheme.
- Additionally, organizations which manage decentralized credentials issue Verified Credentials (VCS) – objects with claims including attestation signed by the issuer.

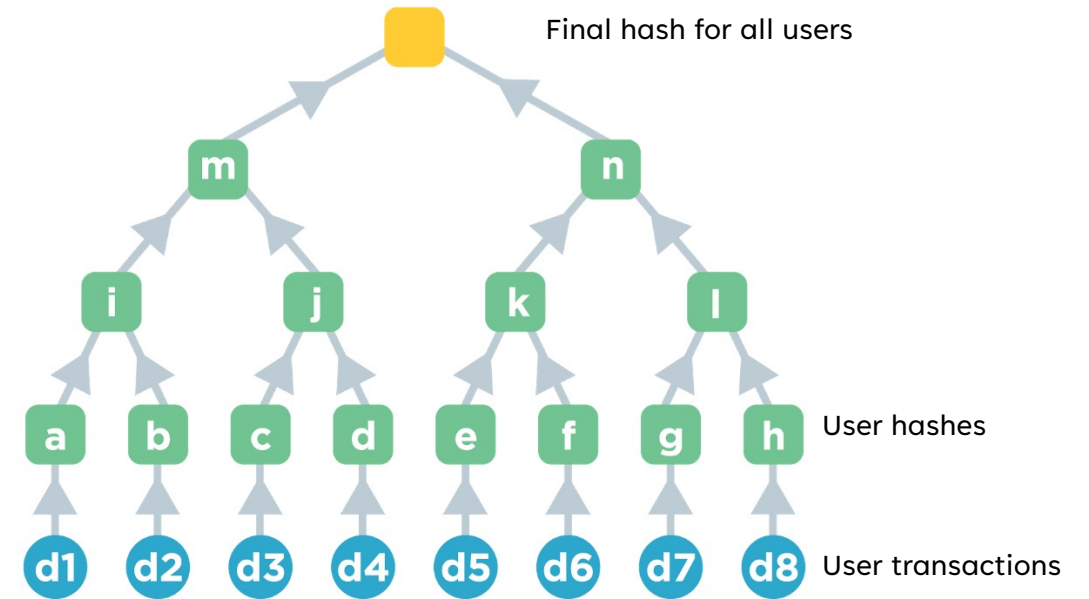

Open standards:

- [W3C Decentralized Identifiers](#)
- [W3C Verifiable Credentials](#)
- [DIF Sidetree](#)
- [DIF Well Known DID Configuration](#)
- [DIF DID-SIOP](#)
- [DIF Presentation Exchange](#)

AuthNull improves your security & compliance through **TAMPER PROOF CREDENTIALS. BLOCKCHAIN IMMUTABILITY**

- On AuthNull - All credentials are tamper proof.
- A blockchain is an immutable data store that enables us to store a non tamperable record of transaction history.
- To enable tamper proof transaction history and credentials, Authnull does the following:
 - All authentication and transactions issued by the platform are issued a cryptographic [Merkle hashes that form a part of a Merkle tree](#)
 - Merkle root hashes are written to an Ethereum address (or any private blockchain).
 - All data stored on Ethereum is encrypted using the Organization's private key
- Any suspicious transaction will mark the given users transaction history as "tampered" as a new hash that was generated does not tally with existing hash.

SECURITY & COMPLIANCE

AAL2 Compliant

* Undergoing updated SOC2 certification

WHY CHOOSE AUTHNULL?

SIMPLE, SECURE PLATFORM

Highly secure platform with two roots of trust

Simplified platform provides all in one solution

Lower cost of ownership with lower IT management burden

No attack vector: Thanks to decentralized credentials, a centralized attack vector is completely removed.

CLOUD BASED, AND AVAILABLE AS ON PREM

Iterative approaches to corporate strategy

Available on prem, as well as cloud.

Highly competitive cost.
